1.0 Generalita'

TRAMEC si presenta oggi sul mercato con la nuova gamma di riduttori a vite senza fine con le seguenti serie:

1.0 General information

TRAMEC has introduced on the market a new range of worm gearboxes available in series:

1.0 Allgemeines

TRAMEC hat auf dem Markt eine neue Auswahl an Schneckengetrieben in Serie herausgebracht:

Serie SFK, BFK

Riduttori a vite senza fine con forma rotonda, realizzati in alluminio pressofuso, che consente ingombri e pesi inferiori. Svariate possibilità di versioni sono facilmente otteneibili anche grazie ai suoi particolari di collegamento (piedi e flange) che sono separati.

SFK, BFK Series

Worm gearboxes with round shape, made cast aluminum, are light in weight and require reduced space. The coupling parts (feet and flanges) are separated and therefore offer the possibility to obtain countless versions.

Serie SFK, BFK

Schneckengetriebe in rundem Gehäuse aus Aluminiumguss, weisen ein geringes Gewicht auf und benötigen wenig Platz. Die Anbauteile (Fuesse und Flansche) sind modular aufgebaut, wodurch viele unterschiedliche Versionen möglich sind.

Serie SCFK, BCFK

Riduttore combinato a doppia vite senza fine caratterizzato da elevate riduzioni di velocità.

SCFK, BCFK Series

Worm gearbox with cylindrical pre-stage Combined worm gearbox with double worm shaft, it offers high speed reductions.

Serie SCFK, BCFK

Kombinierte Doppelschneckengetriebe ermöglichen eine hohe Anzahl an Unterstzungsmöglichkeiten.

1.2 Potenza

P = Potenza massima applicabile in entrata con vite ad albero maschio riferita alla velocità n₁ con un fattore di servizio FS = 1 e a un servizio continuo S1.

P₁ = Potenza motore consigliata riferita alla velocità n₁ con il fattore di servizio FS riportato in tabella a pag. 4 e a servizio continuo S1.

E' possibile determinare la potenza necessaria in entrata P' in base alla coppia T_{2'} richiesta all'applicazione secondo la seguente formula:

1.2 Power

P = max. power applicable at input with male worm shaft, referred to n₁ speed, service factor FS=1, on S1 continuous

P₁ = recommended motor power, referred to n₁ speed, service factor FS as reported in the table on page 4, on S1 continuous duty.

The power necessary at input on the basis of T₂ torque required by the application can be calculated with the following formula:

$$P' = \frac{T_2' \cdot n_2}{9550 \cdot Rd} \quad [\text{kW}]$$

1.3 Rapporto di riduzione

i_n = È il rapporto di riduzione della velocità, definito come:

1.3 Reduction Ratio

i_n = speed reduction ratio, defined as follows:

$$i_n = \frac{n_1}{n_2}$$

1.4 Momento torcente

T_{2M} = È la massima coppia trasmissibile in uscita del riduttore con carico uniforme riferito alla velocità n₁ con un fattore di servizio FS =1 e a servizio continuo S1.

T₂ = È la coppia in uscita del motoriduttore riferita alla velocità n₁ alla potenza P₁, con il fattore di servizio FS riportato in tabella e a servizio continuo S1.

1.4 Torque

T_{2M} = max. torque transmissible at gearbox output with uniform load, referred to n₁ speed, service factor FS = 1, on S1 continuous duty.

T₂ = output torque transmissible to the geared motor, referred to n₁ speed, P₁ power , FS service factor as reported in the table, on S1 continuous duty.

1.2 Leistung

P = am Antrieb max. anwendbare Leistung, mit Schneckenwellenzapfen bez. n₁ Antriebsdrehzahl, Betriebsfaktor FS=1 und S1 Dauerbetrieb.

P₁ = empfohlene Motorleistung bez. n₁ Drehzahl, FS Betriebsfaktor (wie es in der Tabelle auf Seite 4 angegeben wird) und S1 Dauerbetrieb.

Die am Antrieb erforderliche Leistung P' (auf Grund des von der Anwendung verlangten T₂ Drehmoments) kann wie folgt kalkuliert werden:

1.3 Untersetzungsverhältnis

i_n = Drehzahluntersetzungsverhältnis, wird wie folgt definiert:

$$T_{2M} = \frac{9550 \cdot P_1 \cdot Rd}{n_2} \quad [\text{Nm}]$$

1.5 Fattore di servizio FS

È il valore che tiene in considerazione le varie condizioni di funzionamento:

- tipologia di applicazione ovvero natura del carico (A-B-C)
- durata di funzionamento (ore giornaliere h/d)
- numero di avviamenti/ora

Il coefficiente così trovato (FS) dovrà essere uguale o inferiore al fattore di servizio del riduttore da adottare FS' dato dal rapporto tra la coppia T_{2M} indicata a catalogo e la coppia T_2' richiesta dall'applicazione.

1.5 FS Service factor

Value which takes the different operating conditions into consideration:

- type of application or type of load (A-B-C)
- length of operation (hours per day h/d)
- number of start-ups/hour

This coefficient (FS) will have to be equal or lower than the FS of selected gearbox FS' given by the ratio between T_{2M} torque mentioned in the catalogue and the T_2' torque required by the application.

1.5 Betriebsfaktor FS

Wert, der die verschiedenen Betriebsbedingungen in Betracht zieht:

- Art der Anwendung oder Art der Last (A-B-C)
- Betriebsdauer (Stunden pro Tag)
- Anzahl der Starts pro Stunde

Der so berechnete Koeffizient (FS) muss kleiner oder gleich dem Betriebsfaktor FS' des Getriebes sein, welcher sich aus dem Verhältnis zwischen dem im Katalog angegebenen maximalen Drehmoment T_{2M} und dem von der Anwendung benötigten Drehmoment T_2' ergibt.

$$FS' = \frac{T_{2M}}{T_2'} > FS$$

I valori di FS indicati in tabella sono relativi all'azionamento del motore elettrico; se utilizzato un motore a scoppio, si dovrà tenere conto di un fattore di moltiplicazione 1.3 se a più cilindri e 1.5 se monocilindro. Se il motore elettrico applicato è autorefrante occorre considerare un numero di avviamenti doppio di quello effettivamente richiesto.

FS values reported in the table refer to employment of an electric motor; should a combustion motor be used, consider a multiplication factor of 1.3 for a multicylinder motor, of 1.5 for a single-cylinder one. If an electric brake motor is used, consider a number of start-ups which is twice as much the number actually required.

Die in der Tabelle angegebenen FS Werte beziehen sich auf die Anwendung eines Elektromotors. falls ein Verbrennungsmotor verwendet wird, sollte ein Multiplikationsfaktor von 1.3 für Mehrzylindermotor oder von 1.5 für Einzylindermotor in Betracht gezogen werden. Falls es sich um einen Elektro-Bremsmotor handelt, dann ist die Anzahl der Starts doppelt zu zählen.

1.6 Rendimento

Rd - È il rendimento dinamico, definito come rapporto tra la potenza in uscita P_2 e quella in entrata P_1 . Questo dipende principalmente dalla velocità di strisciamento, dal tipo di lubrificante e dall' angolo d'elica; durante la fase di rodaggio il suo valore risulta essere sensibilmente inferiore rispetto a quello riportato nelle tabelle delle prestazioni.

Rs - È il rendimento statico che si ha al momento dell' avviamento del riduttore e varia in base al rapporto di riduzione.

Risulta importante, per una corretta valutazione del riduttore da impiegare, nelle applicazioni in cui non si raggiungono mai le condizioni di regime come nei funzionamenti intermittenti.

Analogalmente al caso dinamico, anche il rendimento statico tende ad aumentare durante la fase di rodaggio e tiene conto della resistenza al moto sviluppata nell' ingranamento vite /corona, nei paraoli e nei cuscinetti.

1.6 Efficiency

Rd - dynamic efficiency, defined as the ratio between P_2 output power and P_1 input power. It mainly depends on the slipping speed, the type of lubricant and the lead angle. During the running-in period its value is sensibly inferior compared to that reported in the table of performance.

Rs - static efficiency at gearbox start-up; it changes depending on the reduction ratio.

Rs value is important for selecting the right gearbox for applications where a steady state is never achieved, as for intermittent duty applications.

Same as dynamic efficiency, static efficiency too tends to grow during the running-in period; it is influenced by the resistance to motion developed in the mesh worm shaft / wheel, in the oil seals and in the bearings.

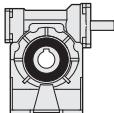

1.6 Wirkungsgrad

Rd - dynamischer Wirkungsgrad, ist das Verhältnis zwischen P_2 Abtriebsleistung und P_1 Antriebsleistung. Der Wert Rd wird durch die Gleit, Art des Schmiermittels und den Steigu beeinflusst. Während der Einlaufszeit ist dieser Wert erheblich niedriger als der in der Leistungstabelle angegebenen Wert.

Rs - statischer Wirkungsgrad bei Getriebestillstand.

Der Wert Rs ist wichtig für Anwendungen ohne stetigem Betrieb, z.B. im Aussetzbetrieb.

Der statische Wirkungsgrad neigt zur Steigerung während der Einlaufszeit. Er wird durch den Bewegungswiderstand, resultierend aus der Haftreibung der Schnecke und des Zahnrades, der Dichtungen und der Lager beeinflusst.

SFK BFK	Rs										
	7.5	10	15	20	25	30	40	50	65	80	100
30	0.76	0.70	0.62	0.54	0.48	0.46	0.38	0.33	0.31	0.29	0.21
40	0.77	0.71	0.63	0.57	0.50	0.48	0.42	0.35	0.32	0.31	0.23
50	0.77	0.71	0.64	0.59	0.52	0.50	0.44	0.37	0.35	0.32	0.23
63	0.78	0.72	0.65	0.60	0.54	0.51	0.45	0.39	0.37	0.35	0.23
75	0.78	0.73	0.66	0.61	0.55	0.52	0.46	0.40	0.38	0.36	0.24

Stabilito il rapporto di riduzione necessario all'applicazione, dove è possibile, è consigliabile utilizzare i diversi tipi di riduttori che offrono, a parità di rapporto, un migliore rendimento dinamico.

Once the reduction ratio required by the application has been established, it is advisable to select a type of gearbox which, ratio being equal, offers better dynamic efficiency.

Nachdem das für die Anwendung erforderliche Untersetzungsverhältnis festgelegt ist, wählen Sie bei gleichem Untersetzungsverhältnis einen Getriebetyp, der einen besseren dynamischen Wirkungsgrad aufweist.

1.7 Irreversibilità

Nelle applicazioni dove è necessario evitare la trasmissione del moto retrogrado o sostenere il carico, in assenza di alimentazione elettrica, è consigliabile adottare freni esterni.

Nei riduttori a vite senza fine emerge questa caratteristica naturale, denominata grado di irreversibilità, che cresce con l'aumentare del rapporto di riduzione in quanto strettamente legata al relativo rendimento.

Per ottenere alti gradi di irreversibilità occorre quindi adottare i rapporti di riduzione più elevati, senza dimenticare che, il rendimento, tende a crescere durante le prime 500 ore di funzionamento per poi stabilizzarsi sui valori riportati a catalogo.

1.7 Irreversibility

The use of external brakes is advised in case of applications where backwards motion must be hindered and the load must be held should the feed be cut off.

Some worm gearboxes feature natural irreversibility. The higher the ratio, the higher is the irreversibility, since it is strictly dependent on the relative efficiency.

In order to achieve high irreversibility it is therefore necessary to select higher efficiency reduction ratios not to forget that the efficiency is growing during the first 500 hours life until it stabilizes to the values mentioned in the catalogue.

1.7 Selbsthemmung

Aussenbremsen sind bei Anwendungen zu benutzen, bei denen die Rückbewegung der Last nicht gewünscht ist und auch im Falle eines fehlenden Antriebsmomentes der Stillstand des Getriebes gefordert ist.

Einige Schneckengetriebe sind selbsthemmend. Je höher die Untersetzung ist, desto höher ist die Selbsthemmung, da diese stark vom jeweiligen Wirkungsgrad abhängig ist. Um eine höhere Selbsthemmung zu erreichen, wählen Sie bitte höhere Untersetzungsverhältnisse.

Bitte beachten Sie, dass der Wirkungsgrad der Getriebe in den ersten 500 Betriebsstunden ansteigt und sich erst anschließend auf die im Katalog angegebenen Werte stabilisiert.

Irreversibilità statica

Condizione di impedimento alla rotazione comandata dall'albero lento senza escludere possibili ritorni lenti nel caso in cui il carico sia sottoposto a vibrazioni.

Rs < 0.45 si ha irreversibilità
Rs = 0.45 ÷ 0.55 irreversibilità incerta
Rs > 0.55 si ha reversibilità

Static irreversibility

Static irreversibility occurs when the rotation controlled by the output shaft is hindered; possible slow returns cannot be excluded should the load be subject to vibrations.

Rs < 0.45 provides irreversibility
Rs = 0.45 ÷ 0.55 irreversibility is uncertain
Rs > 0.55 reversibility is possible

Statische Selbsthemmung

Statische Selbsthemmung liegt vor, wenn ein durch die Last auf die Abtriebswelle wirkendes Drehmoment keine Drehung erzeugt. Langsamer Rücklauf ist möglich, falls die Last Schwingungen ausgesetzt ist.

Rs < 0.45 es liegt Selbsthemmung vor
Rs = 0.45 ÷ 0.55 ungewisse Selbsthemmung
Rs > 0.55 es liegt Reversibilität vor

Irreversibilità dinamica

Condizione di arresto e quindi di sostegno del carico nel momento in cui cessa l'azione di comando. La condizione è più difficile da ottenere in quanto viene influenzata dal rendimento dinamico, dalla velocità di rotazione, da eventuali vibrazioni che il carico può generare e dalla direzione del movimento rispetto al carico.

Quest'ultima condizione è molto evidente nei sollevamenti:
 un carico in salita, cessando l'azione di comando, deve arrestarsi e quindi assumere velocità zero (rendimento statico) prima di invertire il moto e cadere per gravità.
 Un carico in discesa tende invece a proseguire nel suo moto ostacolato, nella caduta, dal solo rendimento dinamico.

Rd < 0.45 si ha irreversibilità
Rd = 0.45 ÷ 0.55 irreversibilità incerta
Rd > 0.55 si ha reversibilità

Dynamic irreversibility

*Dynamic irreversibility is characterized by stillstand and hold of the load when the drive stops.
 It is more difficult to achieve this condition because it is influenced by dynamic efficiency, speed of rotation and possible vibrations generated by the motion direction with regard to the load.*

This last condition is much more evident during the lifting : if the drive stops during the lifting of the load this has to come to a standstill before the reversal of motion rotation and its drop for gravity.

On the contrary the load during its descent gets its motion obstructed by its dynamic efficiency.

Rd < 0.45 provides irreversibility
Rd = 0.45 ÷ 0.55 irreversibility is uncertain
Rd > 0.55 reversibility is possible

Dynamische Selbsthemmung

Dynamische Selbsthemmung ist durch den Stillstand und das Halten der Abtriebswelle trotz Vibrationen der Anwendung charakterisiert.
 Diese Bedingung ist schwieriger zu erreichen, da sie vom dynamischen Wirkungsgrad, der Drehzahl und von der Last verursachten möglichen Vibrationen abhängig ist.

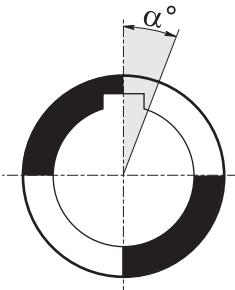

Dieser letzte Fall kommt bei Hubanwendungen stark zu tragen. Wenn der Antrieb während dem Hub stoppt, muss die Last eine Geschwindigkeit von annähernd 0 erreichen (statische Irreversibilität), bevor die Rotation sich umkehrt und die Last durch die Gravitation nach unten fährt.
 Dem entgegengesetzt bekommt die Last durch die Abwärtsbewegung Ihre dynamische Effizienz.

Rd < 0.45 es liegt Selbsthemmung vor
Rd = 0.45 ÷ 0.55 ungewisse Selbsthemmung
Rd > 0.55 es liegt Reversibilität vor

1.10 Carichi radiali

Ogni tipo di organo di trasmissione che viene collegato o sull'albero in entrata o in quello di uscita determina carichi radiali rispettivamente Fr_1 e Fr_2 .

I valori riportati in tabella in funzione delle varie velocità in entrata e in uscita (consultabili nelle sezioni dedicate) sono da considerarsi applicabili come forza agente a metà della sporgenza; per un posizionamento a 1/3 della lunghezza occorre aumentare i valori di tabella del 25% mentre per un posizionamento a 2/3 della lunghezza occorre diminuire gli stessi valori del 25%.

I valori dei carichi assiali applicabili in entrata Fa_1 e in uscita Fa_2 sono indicati nelle tabelle.

Negli alberi bisporgenti, ogni estremità può sopportare un carico radiale pari ai 3/5 dei valori riportati in tabella purché agiscano nello stesso senso e siano di pari intensità.

1.10 Radial load

Any transmission device coupled to either the input or the output shaft generates radial loads, Fr_1 and Fr_2 respectively.

The load values reported in the table, depending on input and output speed, available in sections, are to be considered as acting at the half-way point of the projection; if the load is applied at 1/3 of the projection, increase the values in the table by 25%; if the load is applied at 2/3, reduce the values by 25%.

Axial loads applicable at input Fa_1 and at output Fa_2 are reported in the tables.

With regard to double projecting shafts, each end can sustain a radial load which equals 3/5 of the values listed in the table, on condition that they act in the same direction and have the same intensity.

1.10 Radial load

Antriebsorgane, die mit der Antriebs- oder Abtriebswelle verbunden werden, bewirken Radialbelastungen (Fr_1 und Fr_2 beziehungsweise).

Die in der Tabelle nach Antriebs- und Abtriebsdrehzahl angegebenen Werte beziehen sich auf Belastungen, die in der Mitte der herausragenden Welle wirken; falls die Belastung auf 1/3 der Länge wirkt, sollten die in der Tabelle angegebenen Werte um 25% erhöht werden; falls sie auf 2/3 der Länge wirkt, sollten die Werte der Tabelle um 25% reduziert werden.

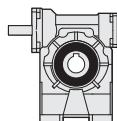

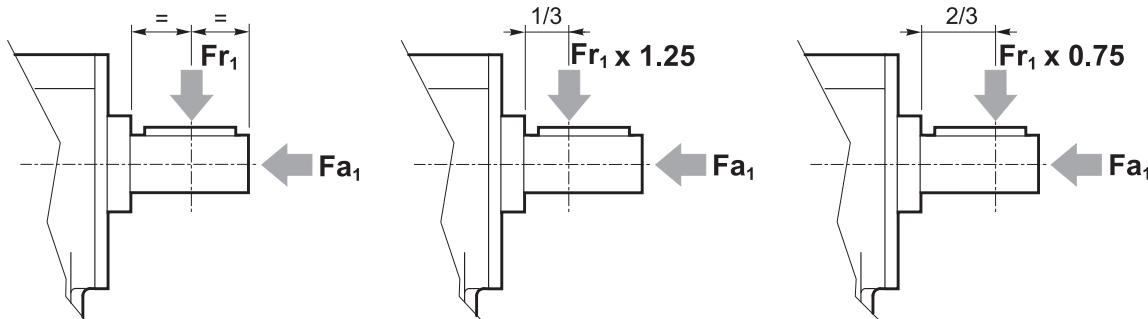

Die Werte der anwendbaren Axialbelastungen (Fa_1 am Antrieb und Fa_2 am Abtrieb) werden in den Tabellen angegeben.

Bei doppelseitig herausragenden Wellen darf die Radialbelastung auf jedes Ende 3/5 der nachstehenden Werte betragen, unter der Bedingung dass Stärke und Richtung gleich sind.

Versioni rinforzate

A richiesta vengono fornite versioni rinforzate con cuscinetti a rulli conici sulla corona in grado di sopportare carichi superiori rispetto a quelli ammessi nelle versioni normali con cuscinetti radiali a sfere.

Essendo tali valori calcolati in funzione della durata dei cuscinetti, occorre valutare attentamente il tipo di versione più idoneo in modo da evitare problemi di tipo strutturale. In particolare, il carico assiale deve agire in modo da comprimere la flangia uscita.

I carichi assiali e radiali riportati in tabella non possono agire contemporaneamente nei loro valori massimi.

Nel caso di eventuale concorrenza delle due forze, queste devono essere limitate in rapporto al tipo di carico prevalente:

1. condizione di prevalenza del carico radiale:

Fr_2 = come a tabella
 $Fa_2 = Fr_2 \cdot 0.37$

Reinforced versions

The versions reinforced with tapered roller bearings on the worm wheel are available on request. They can bear higher loads compared to standard versions with radial ball bearings.

These values are calculated in relation of the life of bearings therefore it is necessary to select the most suitable version in order to avoid any structural problem.

In particular the axial load must compress the output flange.

The axial and radial loads shown in the table do not have to act simultaneously according to the max. values.

In case of concurrency of both forces these have to be reduced with regard to the prevailing type of load:

1. prevalence of radial load:

Fr_2 = as per table
 $Fa_2 = Fr_2 \cdot 0.37$

Versionen mit Kegelrollenrager

Auf Wunsch können Versionen mit Kegelrollenlager auf dem Schneckenrad geliefert werden. Sie erlauben höhere Lasten in Vergleich zu den Standardprodukten mit Schrägkugellagern.

Diese Werte sind entsprechend der Lebensdauer der Lager berechnet. Daher ist es erforderlich, die am besten passende Ausführung zu wählen, um Probleme zu vermeiden. Bei Verwendung eines Abtriebsflansches muß die Axilkraft diesen auf das Getriebegehäuse pressen.

Die in der Tabelle angegebenen Maximalwerte der Axial - und Radialbelastung sollten nicht gleichzeitig auftreten.

Falls Axial-und Radialbelastungen auftreten, sollte jene Belastungsrichtung zur Auswahl herangezogen werden, die vom Anteil überwiegt:

1. Radialbelastungen überwiegen:

Fr_2 = siehe Tabelle
 $Fa_2 = Fr_2 \cdot 0.37$

2. condizione di prevalenza del carico 2. prevalence of axial load:

2. Axialbelastungen überwiegen assiale:

$$Fa_2' = Fa_2 \cdot 0.6$$

$$Fr_2' = Fa_2 \cdot 0.4$$

$$Fa_2' = Fa_2 \cdot 0.6$$

$$Fr_2' = Fa_2 \cdot 0.4$$

$$Fa_2' = Fa_2 \cdot 0.6$$

$$Fr_2' = Fa_2 \cdot 0.4$$

1.11 Potenza termica

Nelle tabelle riportate nelle sezioni relative ad ogni tipologia di riduttore sono indicati i valori della potenza termica nominale P_{t0} [kW]. Tale valore rappresenta la potenza massima applicabile all'entrata del riduttore, in servizio continuo a temperatura massima ambiente di 30°C, così che la temperatura dell'olio non oltrepassi il valore di 95°C.

Il valore di P_{t0} non deve essere preso in considerazione se il funzionamento è continuo per un massimo di 1.5 ore seguito da pause di durata sufficiente (circa 1 - 2 ore) a ristabilire nel riduttore la temperatura ambiente.

I valori di P_{t0} devono essere corretti tramite i seguenti coefficienti, così da considerare le reali condizioni di funzionamento, ottenendo i valori di potenza termica corretta P_{tc} .

The sections dedicated to each type of gearbox contain tables reporting the values of P_{t0} rated thermal power (kW). Listed values represent the max. power applicable at gearbox input, on continuous duty and at an ambient temperature of max. 30°C, so that oil temperature does not exceed 95°C.

P_{t0} value is not to be taken into account if duty is continuous for max. 1.5 hours and followed by breaks which are long enough to bring the gearbox back to ambient temperature (roughly 1 - 2 hours).
In order to take the actual operating conditions into account, P_{t0} values have to be corrected with the following coefficients, thus obtaining the values of P_{tc} corrected thermal power.

Für jeden Getriebetyp werden in den technischen Daten die Nennwerte der thermischen Leistung P_{t0} angegeben [kW]. Diese Werte entsprechen der max. übertragbaren Antriebsleistung des Getriebes in Dauerbetrieb mit einer max. von 30°C, sodass die Öltemperatur unter 95°C bleibt.

Der P_{t0} ist nicht kritisch, falls der Dauerbetrieb max. 1,5 Stunden dauert und von Unterbrechungen gefolgt wird, die lang genug sind, dass Getriebe auf Umgebungstemperatur abkühlen zu lassen (ungefähr 1 - 2 Stunden).

Die P_{t0} Werte sollen durch die folgenden Koeffizienten verbessert werden, damit die reellen Betriebsbedingungen wirklich in Betracht gezogen werden.

Mit der folgenden Formel erhält man die Werte der korrigierten termischen Leistung P_{tc} .

$$P_{tc} = P_{t0} \cdot ft \cdot fv \cdot fu \quad [\text{kW}]$$

Dove:

ft = coefficiente di temperatura
 fv = coefficiente di ventilazione
 fu = coefficiente di utilizzo

Where:

ft = temperature coefficient
 fv = ventilation coefficient
 fu = utilization coefficient

Dabei ist:

ft = Temperaturkoeffizient
 fv = Luftkühlungskoeffizient
 fu = Anwendungskoeffizient

I coefficienti di correzione sono ricavabili dalle seguenti tabelle:

Corrective coefficients are shown in the following tables:

Die Verbesserungskoeffizienten sind aus der nachstehenden Tabelle zu entnehmen:

T _a (°C)	0	5	10	15	20	25	30	35	40	45	50
f _t	1.46	1.38	1.31	1.23	1.15	1.1	1.0	0.92	0.85	0.77	0.69

T_a = Temperatura ambiente (°C)

T_a = ambient temperature (°C)

T_a = Umgebungstemperatur (°C)

f_v = 1.45 con ventilazione forzata efficace con ventola dedicata

f_v = 1.45 for forced ventilation with specific fan

f_v = 1.45 bei Drucklüftung mit spezifischem Lüfterrad

f_v = 1.25 con ventilazione forzata secondaria ad altri dispositivi (puleggi, ventole, motore, ecc.)

f_v = 1.25 for forced ventilation secondary to other devices (pulleys, fans, motor, etc.)

f_v = 1.25 bei Drucklüftung nebensächlich anderen Vorrichtungen (Scheiben, Lüfterräder, Motor, usw.)

f_v = 1 refrigerazione naturale (situazione standard)

f_v = 1 for natural cooling (standard situation)

f_v = 1 natürliche Belüftung (Standard)

f_v = 0.5 in ambiente chiuso e ristretto (carter)

f_v = 0.5 in a close and narrow environment (case)

f_v = 0.5 in engem und geschlossenem Raum (gehäuse)

D _t (min)	10	20	30	40	50	60
f _u	1.6	1.35	1.2	1.1	1.05	1

D_t = minuti di funzionamento in un'ora

D_t = minutes of operation per hour

D_t = Betriebsminuten pro Stunde

1.12 Selezione

Scelta del riduttore

A) n₁ = 1400, 2800, 900, 500 min⁻¹

Si sceglierà nelle tabelle delle prestazioni dei riduttori un gruppo che in corrispondenza di un rapporto prossimo a quello calcolato ammetta una potenza:

1.12 Selection

Selecting a gearbox

A) n₁ = 1400, 2800, 900, 500 min⁻¹

Consult the gearbox unit efficiency table; select a group whose ratio is close to the calculated ratio and which permits power:

1.12 Wahl

Wahl des Getriebes

A) n₁ = 1400, 2800, 900, 500 min⁻¹

Aus der Leistungstabellen ist eine Gruppe von Getrieben zu wählen, deren Übersetzungsverhältnis nahe zu dem berechneten Wert ist und die die folgende Leistung erlaubt:

$$P \geq P' \cdot FS'$$

Scelta del motoriduttore

B) FS =1

Si cercherà nelle tabelle delle prestazioni dei motoriduttori un gruppo la cui potenza P₁ corrisponda alla P' calcolata.

C) FS ≠1

La scelta dovrà essere effettuata come al punto A) verificando che la grandezza del motore da installare sia compatibile con quelle ammesse dal riduttore (IEC); ovviamente la potenza installata dovrà corrispondere al valore P' richiesto.

Determinato il riduttore idoneo è necessario verificare che anche gli eventuali carichi aggiuntivi (radiali ed assiali) agenti sugli alberi in uscita e/o entrata rientrino nei valori ammissibili dati a catalogo.

In determinate condizioni applicative può diventare necessario verificare che la potenza assorbita dal riduttore non superi quella del limite termico riportata a catalogo, secondo quanto riportato al punto 1.10 relativamente alla potenza termica.

Selecting a gearmotor

B) FS =1

Consult the gear motor efficiency table and select a group having power P₁ corresponding to calculated P'.

C) FS ≠1

Follow the instructions at point A), checking that the size of the motor to be installed is compatible with the gearbox unit (IEC); obviously, installed power must correspond to the required P' value.

After having selected the proper gearbox, it is necessary to check out that possible additional loads (radial or axial) on the input and /or output shafts fall within the values reported in the catalogue. Depending on the application, it might be necessary to check that the power absorbed by the gearbox does not exceed the thermal power limit reported in the catalogue as per paragraph 1.10.

Wahl des Getriebemotors

B) FS =1

Wählen Sie aus der Leistungstabelle der motoren eine Gruppe, deren Leistung P₁ der berechneten Leistung P' entspricht.

C) FS ≠1

Folgen Sie den Weisungen unter A). Es ist zu prüfen, ob die Größe des zu installierenden Motor mit dem Getriebe kompatibel ist (IEC); die installierte Leistung Leistung sollte dem erforderlichen P' Wert entsprechen.

Nachdem das geeignete Getriebe gewählt worden ist, muss sichergestellt werden, dass zusätzliche Radial-oder Axialbelastungen auf die Antriebs-oder Abtriebswelle unter denen im Katalog gegebenen Werten liegen.

Abhängig von der Art der Anwendung ist es manchmal zu prüfen, dass die vom Getriebe absorbierte Leistung unter dem Wert der thermischen Leistung liegt, wie im Katalog im Abschnitt 1.10 beschrieben.

1.13 Lubrificazione

Tutti i riduttori sono forniti completi di lubrificante sintetico a base PAG con indice di viscosità ISO VG320.

I cuscinetti dell'albero veloce vengono sempre lubrificati con grasso a base sintetica; altri cuscinetti vengono lubrificati solo se la posizione di montaggio non ne garantisce la corretta lubrificazione.

Una scelta oculata del tipo di lubrificante, in funzione delle condizioni operative e ambientali, consente ai riduttori di raggiungere le prestazioni ottimali.

Le prestazioni dei riduttori indicate nelle tabelle dei dati tecnici sono state calcolate considerando l'impiego di olio sintetico.

VISCOSITÀ

E' uno dei parametri più importanti da considerare nella scelta di un olio ed è influenzabile da diversi parametri quali velocità, temperatura. Riportiamo sinteticamente le valutazioni generali per la scelta della giusta viscosità:

Viscosità alta

Usare per basse velocità di rotazione e/o temperature alte.

(Una viscosità troppo bassa in queste condizioni operative causa una usura precoce).

Viscosità bassa

Usare per alte velocità di rotazione e/o temperature basse.

(Una viscosità troppo elevata provoca diminuzione del rendimento e surriscaldamento).

ADDITIVI

In tutti gli oli minerali sono contenuti degli additivi antiusura, EP (più o meno energici), antiossidanti ed antischiuma. E' opportuno assicurarsi che essi siano blandi e non aggressivi nei confronti delle guarnizioni.

BASE DELL'OLIO

Può essere minerale o sintetica.

L'olio sintetico, compensa il costo più elevato con una serie di vantaggi:

- a) minor coefficiente d'attrito (quindi migliore rendimento)
- b) migliore stabilità nel tempo (possibile lubrificazione a vita)
- c) migliore indice di viscosità (migliore la adattabilità alle varie temperature).

L'olio a base minerale come vantaggi ha il minore costo e un migliore comportamento in rodaggio.

1.13 Lubrication

All worm gearboxes are supplied with synthetic lubricant, PAG base, viscosity index ISO VG 320.

The bearings mounted on the input shaft are supplied with grease, synthetic base; the other bearings are lubricated only if the mounting position does not assure a correct lubrication.

Choose the lubricant according to operating and ambient conditions in order to ensure high gear unit performance.

Performance data, as shown in the specifications tables, refer to utilization of synthetic oil.

VISCOSITY

It is one of the most important parameters to be considered when selecting an oil; it depends on various factors such as speed and temperature. Following are general guidelines for choosing the correct viscosity:

High viscosity

To be used for low rotation speed and/or high temperatures.

(Under these operating conditions a low viscosity causes premature wear).

Low viscosity

To be used for high rotation speed and/or low temperatures.

(High viscosity reduces efficiency and causes overheating).

ADDITIVES

All mineral oils contain additives to protect against wear, EP (more or less strong), anti-oxidizing and anti-frothing. It is advisable to make sure that the action of such additives is bland and not too aggressive on the seals.

OIL BASE

May be mineral or synthetic.

Synthetic oil compensates for the higher cost with a series of advantages:

- a) lower friction coefficient (consequently improved efficiency)
- b) better stability over time (possible life lubrication)
- c) better viscosity index (more adaptable to various temperatures).

Mineral-base oils offer the advantages of costing less and performing better during the running-in period.

1.13 Schmierung

Alle Schneckenradgetriebe, werden mit synthetischem Schmiermittel auf PAG Basis und Viskosität Index ISO VG 320 geliefert.

Die Kugellager auf der Eingangswelle werden immer mit synthetischem Fett geliefert. Falls durch die Einbaulage keine korrekte Schmierung der restlichen Kugellager gewährleistet ist, werden auch diese mit Fett versehen.

Das Untersetzungsgetriebe wird optimal arbeiten, wenn das richtige Schmiermittel je nach Betriebs- und Umgebungsbedingungen sorgfältig ausgewählt wird.

Die Daten über die Getriebeleistung in den Tabellen „Technische Daten“, beziehen sich auf Schmierung mit synthetischem Öl.

VISKOSITÄT

Die Viskosität ist eins der wichtigsten Merkmale, die bei der Auswahl des richtigen Öls zu beachten sind; sie wird von verschiedenen Parametern wie Geschwindigkeit und Temperatur beeinflusst. Im folgenden fassen wir die wichtigsten allgemeinen Hinweise für die Wahl der richtigen Viskosität zusammen:

Hohe Viskosität

Geeignet für niedrige Drehzahlen bzw. hohe Temperaturen. (Eine zu geringe Viskosität verursacht unter diesen Betriebsbedingungen frühzeitigen Verschleiß).

Geringe Viskosität

Geeignet für hohe Drehzahlen bzw. niedrige Temperaturen.

(Eine zu geringe Viskosität führt in diesem Fall zu einer Verringerung des Wirkungsgrades und zur Überhitzung).

ZUSÄTZE

Alle Mineralöle enthalten Antiverschleißzusätze, EP (mehr oder weniger stark), Oxydationsschutzmittel und Wirkstoffe zur Schaumverhinderung. Es sollte sichergestellt werden, daß diese Zusätze schwach sind und die Dichtungen nicht angreifen.

ÖLGRUNDLAGE

Es kann sich dabei um Mineralöl oder synthetisches Öl handeln.

Synthetisches Öl ist zwar teurer, bietet jedoch eine Reihe von Vorteilen:

- a) geringerer Reibungskoeffizient (demnach besserer Wirkungsgrad)
- b) bessere Stabilität über lange Zeit (lebenslange Schmierung möglich)
- c) besserer Viskositätsindex (paßt sich besser an verschiedene Temperaturen an).

Die Vorteile von Mineralöl sind die geringeren Kosten und das bessere Einfahrverhalten.

1.14 Installazione

Fissare il riduttore in modo tale da evitare qualsiasi vibrazione e curare l'allineamento del riduttore con il motore e l'utenza utilizzando, quando è possibile, giunti di accoppiamento.

Assicurarsi che gli organi da montare sui riduttori abbiano le tolleranze ISO h6 per gli alberi e ISO H7 per i fori.

Per tutte le altre avvertenze consultare il manuale di "uso e manutenzione" scaricabile dal sito www.tramec.it

1.14 Installation

Mount the gearbox in such a way that any vibrations are prevented. Check carefully the alignment gearbox / motor / machine and use couplings whenever possible. Check that devices to be mounted on the gearbox feature ISO h6 tolerance for the shafts and ISO H7 for the holes.

For all other instructions check the "Use and Maintenance Manual" which can be downloaded from our web site www.tramec.it

1.14 Installation

Das Getriebe ist so zu installieren, dass allerart Schwingungen vorbeugt wird. Besonders auf die Fluchtung von Getriebe, Motor und Maschine ist zu achten - falls möglich sollten Kupplungen eingesetzt werden. Die auf dem Getriebe montierten Elemente sollen die folgende Toleranz aufweisen: ISO h6 für die Wellen und ISO h7 für die Bohrungen.

Für weitere Informationen laden Sie sich bitte unsere „Instructions manual“ auf unserer Webseite „www.tlsriduttori.it/products/“ herunter.

1.15 Manutenzione

Tutti i riduttori a vite senza fine sono lubrificati a vita con olio sintetico tipo SHELL TIVELA OIL S 320.

Non necessitano quindi di particolari manutenzioni se non il mantenimento della pulizia esterna, evitando l'uso di solventi per non danneggiare guarnizioni o anelli di tenuta, ed il rispetto di tutte le indicazioni e della eventuale sostituzione dell'olio negli intervalli programmati e riportati nel manuale di "uso e manutenzione" scaricabile dal sito www.tramec.it.

1.15 Maintenance

All worm gearboxes are lubricated for life with synthetic oil SHELL TIVELA OIL S 320.

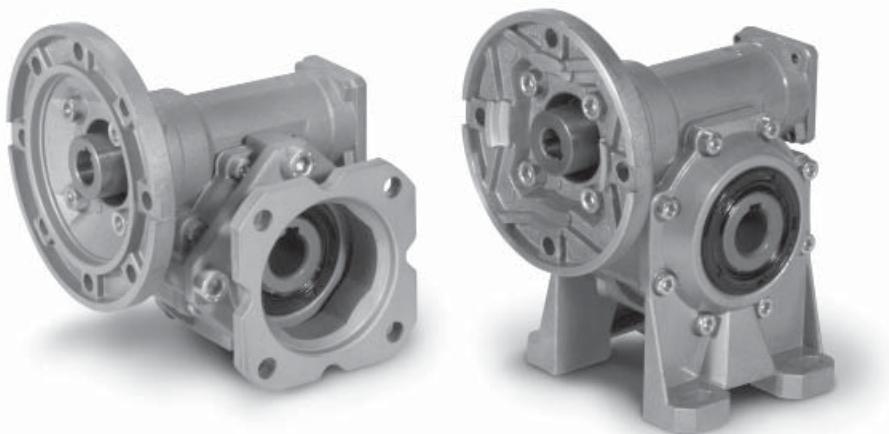

For this reason they do not require any particular maintenance, except for external cleaning (avoid the use of solvents which might damage gaskets and oil seals) and observance of the schedules for oil change as reported in the "Use and Maintenance Manual" which can be downloaded from our web site www.tramec.it.

1.15 Wartung

Alle Schneckengetriebe sind mit synthetischem Öl „SHELL TIVELA OIL S 320“ „lebenslang“ geschmiert, deshalb benötigen sie keine Wartung ausser äußerlicher Reinigung. Bitte befolgen Sie die Zeitabstände für Ölwechsel, wie es in der „Instructions manual“ auf unserer Webseite www.tlsriduttori.it/products/ angegeben wird. Bei der Aussenreinigung benutzen Sie bitte keine Lösemittel, weil diese die Dichtungen beschädigen.

2.1 Caratteristiche

I riduttori della serie a vite senza fine SFK - SRK si presentano estremamente leggeri grazie alla forma compatta e la cassa realizzata in alluminio pressofuso. La serie presenta una svariata possibilità di versioni, con e senza piedi e con numerosi accessori che la rendono più versatile nell'impiego delle più svariate tipologie di applicazioni.

La vite senza fine è in acciaio legato cementato-temprato ed è rettificata. La corona ha mozzo in ghisa con riporto di fusione in bronzo.

2.2 Designazione

2.1 Characteristics

The SFK - SRK worm gearboxes are extremely light thanks to the compact shape of the housing made of cast aluminum. This series features a wide range of versions, with and without feet, with numerous accessories which make it extremely versatile for utilization in various applications.

The worm shaft is ground and is made of hardened-casehardened compound steel.

The worm wheel features a cast iron hub with bronze casting.

2.1 Merkmale

Die Schneckengetriebe der SFK - SRK Serie sind äußerst leicht dank der kompakten Form des Gehäuses aus Aluminiumguss. Die Serie bietet verschiedene Versionen mit und ohne Füße sowie zahlreiche Zubehörteile an, was zur vielseitigen Anwendbarkeit der Getriebe in vielerlei Applikationen dient.

Die Schneckenwelle ist aus legierten gehärteten Einsatzstahl und ist geschliffen. Der Zahnkranz verfügt über eine Nabe aus Gusseisen mit Schmelzeneinsatz aus Bronze.

Specificare sempre in fase di ordinazione la versione.

Specify the version when ordering.

Bei der Bestellung immer die Bauform angeben.

Riduttori a vite senza fine SFK - SRK sono forniti tutti e sempre completi di lubrificante sintetico a base PAG con classe di viscosità ISO 320.
Nei corpi in alluminio 30, 40, 50, 63, 75 è presente un solo tappo di riempimento olio.

Quantità di lubrificante (litri)

SFK SRK	B3	B6-B7	B8	V5-V6
30		0.015		
40		0.040		
50		0.080		
63		0.160		
75		0.260		

Lubricant quantity (liters)

SFK - SRK worm gearboxes are supplied with PAG synthetic lubricant featuring an ISO 320 viscosity class.
Aluminium housings size 30, 40, 50, 63 and 75 have one filling plug only.

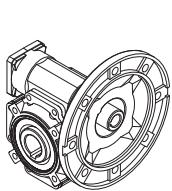

SFK - SRK Schneckengetriebe werden mit PAG synthetischen Schmierstoff Viskositätsklasse ISO 320 geliefert.
Gehäuse aus Aluminium Größe 30, 40, 50, 63 und 75 verfügen nur über eine Einfüllschraube.

* ATTENZIONE: la coppia massima utilizzabile [T_{2M}] deve essere calcolata utilizzando il fattore di servizio: T_{2M} = T₂ x FS'

* WARNING: Maximum allowable torque [T_{2M}] must be calculated using the following service factor : T_{2M} = T₂ x FS'

* ACHTUNG: das max. anwendbare Drehmoment [T_{2M}] muss mit folgendem Betriebsfaktor berechnet werden: T_{2M} = T₂ x FS'

N.B.

Tutte le flange possono essere applicate sui riduttori in versione P, ad eccezione di quelle evidenziate con (*) che possono essere montate solo in presenza di un coperchio pendolare speciale.

All flanges can be applied to the gearbox version of P, except those marked with (*) that can be installed only in presence of a special cover.

Alle Flansche können mit Getrieben der Version P eingesetzt werden, außer denen mit (*) gekennzeichneten - diese sind dann nur in der Kombination mit einem Deckel verwendbar.

2.10 Limitatore di coppia cavo passante

Il limitatore di coppia viene consigliato in tutte quelle applicazioni che richiedono una limitazione sulla coppia trasmissibile per proteggere l'impianto e/o preservare il riduttore evitando sovraccarichi o urti indesiderati quanto inaspettati.

È un dispositivo con albero dotato di cavo passante, con funzionamento a frizione, ed è integrato al riduttore, presentando un ingombro limitato.

Concepito per lavorare a bagno d'olio, il dispositivo risulta affidabile nel tempo ed è esente da usura se non viene mantenuto in condizioni prolungate di slittamento (condizione che si verifica quando la coppia presenta valori superiori a quelli di taratura).

La taratura è facilmente regolabile dall'esterno attraverso il serraggio di una ghiera autobloccante che porta a compres-sione le 4 molle a tazza disposte tra loro in serie.

Il dispositivo non consente:

- l'impiego di cuscinetti a rulli conici in uscita
- funzionamento prolungato in condizio-ni di slittamento.

Nella tabella seguente vengono riportati i valori delle coppie di slittamento M_{2S} in funzione del n° di giri della ghiera.

I valori di taratura presentano una tolle-ranza del $\pm 10\%$ e si riferiscono ad una condizione statica.

In condizioni dinamiche è da notare che la coppia di slittamento assume valori di-versi a seconda del tipo e/o modalità in cui si verifica il sovraccarico: con valori maggiori in caso di carico uniformemente crescente rispetto a valori più contenuti in seguito al verificarsi di picchi improvvisi di carico.

NOTA: quando si supera il valore di taratura si ha slittamento. Il coefficiente di attrito tra le superfici di contatto da statico diventa dinamico e la coppia trasmessa cala del 30% circa.

E' quindi opportuno prevedere uno stop per poter ripartire al valore di taratura ini-ziale.

E' importante notare che la coppia di slit-tamento non resta sempre la medesima durante tutta la vita del limitatore.

Tende infatti a diminuire in rapporto al numero e alla durata degli slittamenti che, rodando le superfici di contatto, ne au-mentano il rendimento.

È quindi opportuno verificare periodica-mente, soprattutto durante la fase di ro-daggio, la taratura del dispositivo.

Là dove sia richiesto un errore più conte-nuto nella taratura, è necessario testare la coppia trasmissibile sull'impianto.

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo di-versa indicazione espressa in fase di or-dinazione.

2 SFK - SRK

2.10 Torque limiter with through hollow shaft

The use of a torque limiter is advisable when the application requires the limitation of the transmissible torque to safe-guard the plant and/or the gearbox from unexpected or undesired overloads.

The torque limiter is equipped with a through hollow shaft and a friction clutch. It is integrated in the gearbox, therefore space requirement is limited.

Designed to be working in oil bath, the de-vice is reliable over time and is not sub-ject to wear unless in case of operation with prolonged slipping (it occurs when the torque values are higher than the cali-bration values).

Calibration can be easily adjusted from outside by tightening of the self-locking ring nut, which causes the compression of the 4 Belleville washers arranged in series.

The device does not go together with:

- the use of tapered roller bearings at output
- prolonged operation under slipping conditions

The following table shows the values of M_{2S} slipping torques depending on the number of revolutions of the ring nut.

Calibration values feature a $\pm 10\%$ tolerance and refer to static conditions.

Under dynamic conditions the values of the slipping torque will change accord-ing to the type of overload: the values are higher if the load increase is uniform; the values are lower if sudden load peaks oc-cur.

NOTE: Slipping occurs when the setting values are exceeded.

The friction coefficient between the con-tact surfaces from static becomes dy-namic and the transmitted torque is ap-prox. 30% lower.

It is advisable to have a stop first in order to have a restart based on the initial set-ting value.

It is important to note that the slipping torque is not the same for the whole life of the torque limiter.

It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lap-ping will increase the efficiency.

For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period.

Should a smaller calibration error be re-quired, it is necessary to test the trans-missible torque on the plant.

The device is supplied already calibrated at the torque reported in the catalogue T_{2M} , unless otherwise specified in the or-der.

2.10 Drehmomentbegrenzer mit durchgehender Hohlwelle

Die Anwendung eines Drehmoment-begrenzers wird empfohlen, um die Anlage und/oder das Getriebe gegen ungewünschte und unerwartete Überbelastungen zu schützen.

Es handelt sich um eine Vorrichtung mit einer durchgehenden Hohlwelle.

Er ist in dem Getriebe integriert, d.h. der Raumbedarf ist klein. Der Begrenzer wurde für Betrieb in einem Ölbad entworfen. Er ist zuverlässig und verschleißfrei (nur im Falle eines dauerhaften Rutschens entsteht Verschleiß, hier ist das Dreh-moment größer als der eingestellte Eich-wert).

Die Eichung kann mühelos von aussen durch das Anziehen einer selbstsperrenden Mutter ausgeführt werden, dadurch wird der Druck auf die 4 wechselseitig angeordneten Tellerfedern erhöht.

Die Vorrichtung sieht das folgende nicht vor:

- die Verwendung von Kegelrollenlager am Abtrieb
- Längerer Rutschbetrieb

Die nachstehende Tabelle zeigt die Werte der Rutschmomente M_{2S} abhängig von der Anzahl der Umdrehungen der Mutter. Die Eichwerte weisen $\pm 10\%$ Toleranz auf und beziehen sich auf statische Bedin-gungen.

Unter dynamischen Bedingungen hat das Rutschmoment verschiedene Werte je nach Art der Überbelastung. Die Werte sind höher, wenn die Belastung gleichmäß-ig zunimmt; sie sind niedriger im Falle von plötzlichen Belastungsspitzen.

BEMERKUNG: Rutschen tritt auf, wenn die eingestellten Werte überschritten werden. Der Reibungsfaktor zwischen den Berührungsflächen wird dynamisch anstatt statisch und das übertragene Dreh-moment sinkt um ca. 30%.

Es ist daher ratsam, vor dem erneuten Anfahren anzuhalten, um die ursprüng-lichen Drehmomentwerte zu erreichen.

Es ist wichtig zu beachten, dass das Rutschmoment über die gesamte Le-bbensdauer der Rutschkupplung nicht konstant bleibt, sondern üblicherweise in Verbindung mit längeren Rutschzyklen aufgrund der eingelaufenen Berührungs-flächen abnimmt.

Deswegen ist es ratsam, die Eichung der Vorrichtung besonders während der Ein-laufzeit zu prüfen.

Falls ein niedrigerer Eichfehler gewünscht ist, sollte das übertragbare Drehmoment auf der Anlage getestet werden.

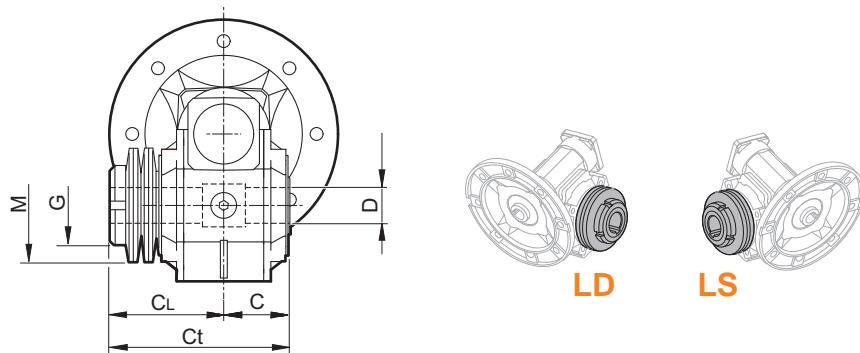

Wenn die Vorrichtung geliefert wird, ist sie schon auf das im Katalog T_{2M} angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders ange-gabe wird.

Nella versione con limitatore non è prevista la fornitura degli alberi lenti.

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo diversa indicazione espressa in fase di ordinazione.

The version with torque limiter is supplied without output shafts.

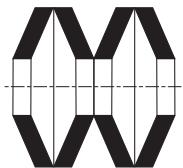

The device is supplied already calibrated at the torque reported in the catalogue T_{2M} , unless otherwise specified in the order.

Die Version mit Drehmomentbegrenzer wird ohne Abtriebswellen geliefert.

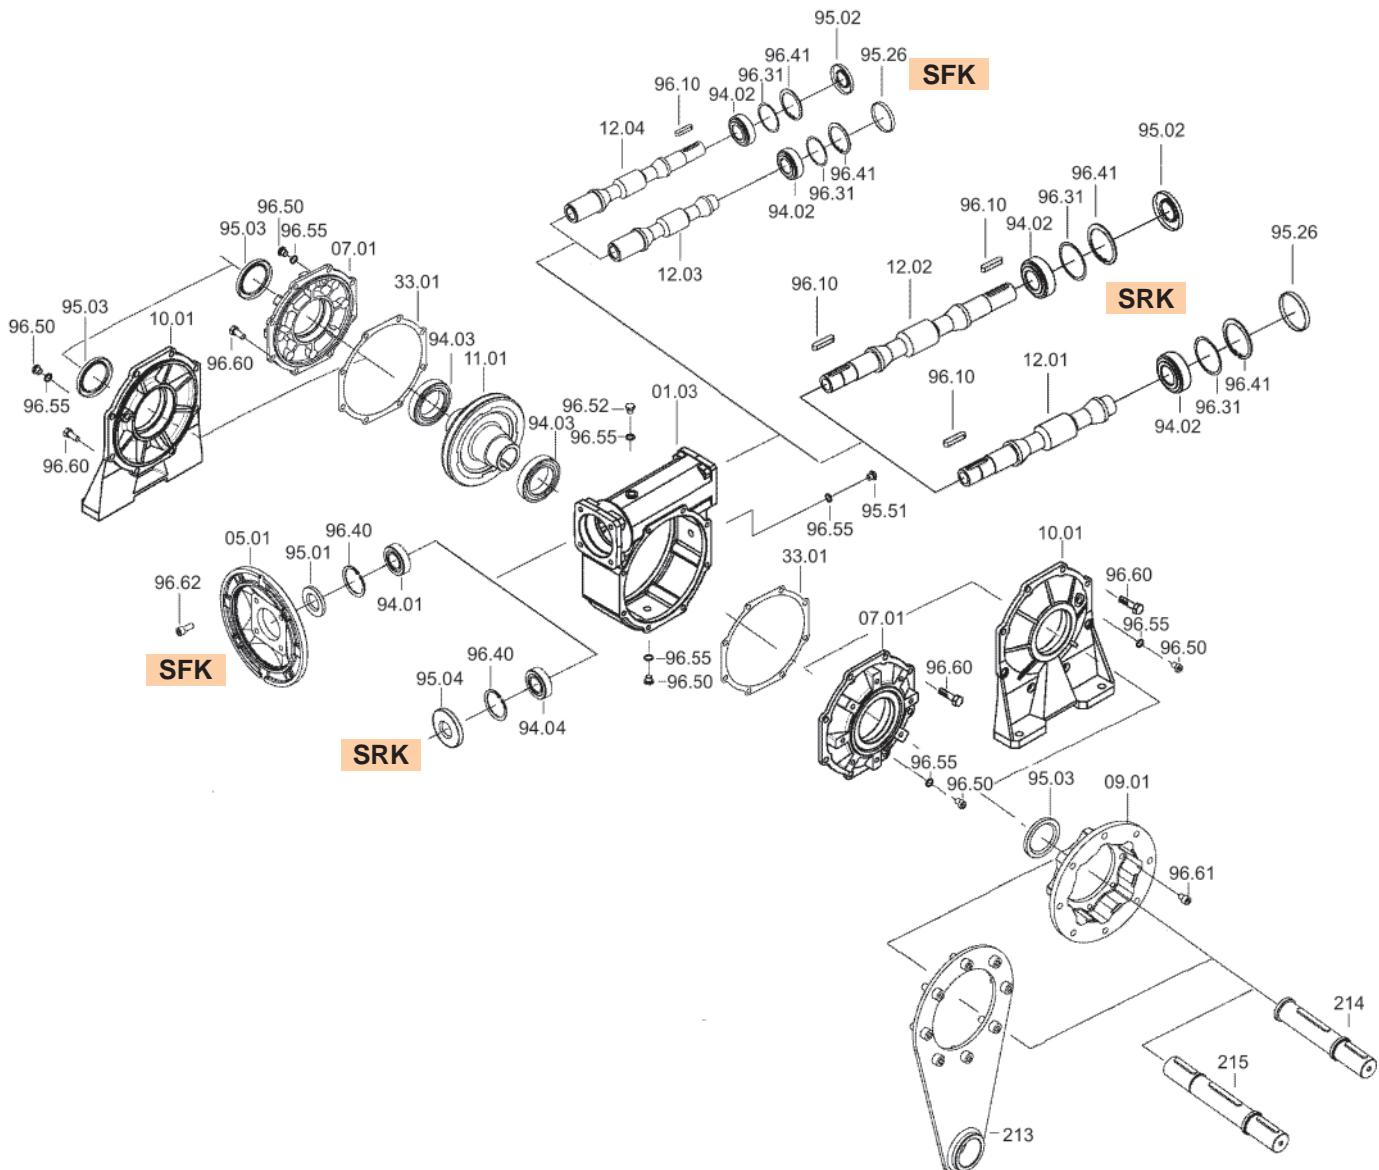

Wenn die Vorrichtung geliefert wird, ist sie schon auf das im Katalog mit T_{2M} angegebene Drehmoment geeicht, ausser wenn es in der Bestellung anders angegeben wird.

3.1 Caratteristiche

La combinazione di due riduttori a vite senza fine comporta rendimenti molto bassi, ma l'elevata riduzione di velocità ottenuta in uno spazio ridottissimo rende comunque interessante, e a volte insostituibile, questa soluzione.

Sono forniti con albero cavo di serie ed esiste un'ampia gamma di accessori: seconda entrata, cuscinetti conici sulla corona, flangia uscita, albero lento con 1 o 2 sporgenze, limitatore di coppia con cavo passante, braccio di reazione.

3.1 Characteristics

The combination of two worm gearboxes provides very low efficiency, however the fact that substantial reduction in speed can be obtained in an extremely reduced space makes this solution very interesting and sometimes irreplaceable.

The hollow shaft is supplied as standard. A broad range of accessories is available: second input, tapered roller bearings on the worm wheel, output flange, single or double extended output shaft, torque limiter with through hollow shaft, torque arm.

3.1 Merkmale

Die Kombination zweier Schneckengetriebe bringt sehr niedrigen Wirkungsgrad mit sich, es handelt sich jedoch um eine interessante und manchmal unersetzbare Lösung, weil eine hohe Drehzahlverringerung in einem beträchtlich reduzierten Raum erzielt werden kann.

Die Hohlwelle gehört zur serienmäßigen Ausstattung. Eine breite Auswahl an Zubehör ist erhältlich: zweiter Antrieb, Kegelrollenlager auf Schneckenrad, Abtriebsflansch, standard oder doppelseitig herausragende Abtriebswelle, Drehmomentbegrenzer mit durchgehender Hohlwelle, Drehmomentstütze.

3.3 Lubrificazione

I riduttori a vite senza fine SCFK - SCRK sono forniti tutti e sempre completi di lubrificante sintetico a base PAG con classe di viscosità ISO 320.
Nei corpi in alluminio è presente un solo tappo di riempimento olio.
Si raccomanda di precisare sempre in fase di ordine la forma costruttiva e la posizione di lavoro desiderata.

3.3 Lubrication

SCFK - SCRK worm gearboxes are supplied with PAG synthetic lubricant featuring an ISO 320 viscosity class.
Aluminium housings have one filling plug only.
Always specify the version and the mounting position when ordering.

3.3 Schmierung

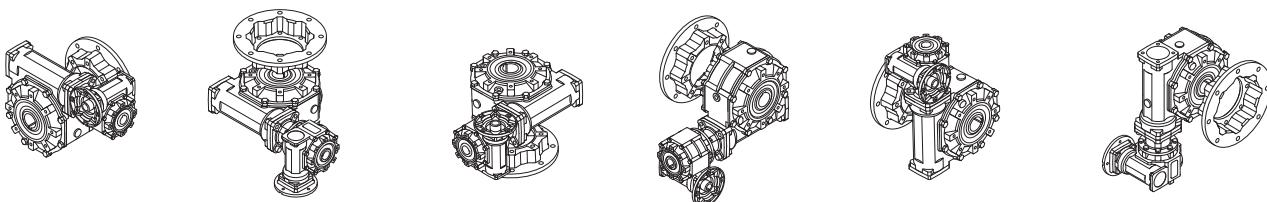

SCFK - SCRK Schneckengetriebe werden mit PAG synthetischen Schmierstoff Viskositätsklasse ISO 320 geliefert.
Gehäuse aus Aluminium verfügen über nur eine Einfüllschraube.
Im Auftrag sind immer Einbaulage und Bauform anzugeben.

L'entrata supplementare del riduttore in uscita (SeA2) non può essere utilizzata come comando in quanto il relativo movimento risulta impedito dalla irreversibilità del primo riduttore.

Utilizzato come asse condotto, avrà velocità corrispondente a quella di ingresso ridotta del rapporto del primo riduttore.

The second input shaft of the output gearbox (SeA2) can not be utilized as a drive because its motion will be stopped by the reversibility of the first gearbox.

If utilized as a drive shaft its speed will be equal to the input speed decreased by the ratio of the first gearbox.

Die verlängerte Schneckenwelle des zweiten Getriebes (SeA2) kann nicht als Antrieb verwendet werden, da die Selbsthemmung des ersten Getriebes entgegen gewirkt.

Wird sie als Abtriebswelle verwendet, besitzt sie eine um die Untersetzung des ersten Getriebes entsprechend reduzierte Drehzahl und Drehmoment.

3 SCFK - SCRK

3.10 Limitatore di coppia cavo passante

Il limitatore di coppia viene consigliato in tutte quelle applicazioni che richiedono una limitazione sulla coppia trasmissibile per proteggere l'impianto e/o preservare il riduttore evitando sovraccarichi o urti indesiderati quanto inaspettati.

È un dispositivo con albero dotato di cavo passante, con funzionamento a frizione, ed è integrato al riduttore, presentando un ingombro limitato.

Concepito per lavorare a bagno d'olio, il dispositivo risulta affidabile nel tempo ed è esente da usura se non viene mantenuto in condizioni prolungate di slittamento (condizione che si verifica quando la coppia presenta valori superiori a quelli di taratura).

La taratura è facilmente regolabile dall'esterno attraverso il serraggio di una ghiera autobloccante che porta a compresione le 4 molle a tazza disposte tra loro in serie.

Il dispositivo non consente:

- l'impiego di cuscinetti a rulli conici in uscita
- funzionamento prolungato in condizioni di slittamento.

Nella tabella seguente vengono riportati i valori delle coppie di slittamento M_{2S} in funzione del n° di giri della ghiera.

3.10 Torque limiter with through hollow shaft

The use of a torque limiter is advisable when the application requires the limitation of the transmissible torque to safeguard the plant and/or the gearbox from unexpected or undesired overloads.

The torque limiter is equipped with a through hollow shaft and a friction clutch. It is integrated in the gearbox, therefore space requirement is limited.

Designed to be working in oil bath, the device is reliable over time and is not subject to wear unless in case of operation with prolonged slipping (it occurs when the torque values are higher than the calibration values).

Calibration can be easily adjusted from outside by tightening of the self-locking ring nut, which causes the compression of the 4 Belleville washers arranged in series.

The device does not go together with:

- the use of tapered roller bearings at output
- prolonged operation under slipping conditions

The following table shows the values of M_{2S} slipping torques depending on the number of revolutions of the ring nut.

3.10 Drehmomentbegrenzer mit durchgehender Hohlwelle

Die Anwendung eines Drehmomentbegrenzers wird empfohlen, um die Anlage und/oder das Getriebe gegen ungewünschte und unerwartete Überbelastungen zu schützen.

Es handelt sich um eine Vorrichtung mit einer durchgehenden Hohlwelle.

Er ist in dem Getriebe integriert, d.h. der Raumbedarf ist klein. Der Begrenzer wurde für Betrieb in einem Ölbad entworfen.

Er ist zuverlässig und verschleißfrei (nur im Falle eines dauerhaften Rutschens entsteht Verschleiß, hier ist das Drehmoment größer als der eingestellte Eichwert).

Die Eichung kann mühelos von außen durch das Anziehen einer selbstsperrenden Mutter ausgeführt werden, dadurch wird der Druck auf die 4 wechselseitig angeordneten Tellerfedern erhöht.

Die Vorrichtung sieht das folgende nicht vor:

- die Verwendung von Kegelrollenlager am Abtrieb
- Längerer Rutschbetrieb

Die nachstehende Tabelle zeigt die Werte der Rutschmomente M_{2S} abhängig von der Anzahl der Umdrehungen der Mutter. Die Eichwerte weisen $\pm 10\%$ Toleranz

SCFK SCRK	N°. giri della ghiera di regolazione / N°. revolutions of ring nut Nr. Umdrehungen der Mutter								
	1	1 1/4	1 1/2	1 3/4	2	2 1/4	2 1/2	2 3/4	3
M _{2S} [Nm]									
30/30	22	27	33	38	43	—	—	—	—
30/40	55	64	73	87	—	—	—	—	—
30/50	75	97	120	157	—	—	—	—	—
30/63 40/63	—	127	155	180	205	262	260	282	—
40/75 50/75	—	—	235	265	295	327	360	407	455

I valori di taratura presentano una tolleranza del $\pm 10\%$ e si riferiscono ad una condizione statica.

In condizioni dinamiche è da notare che la coppia di slittamento assume valori diversi a seconda del tipo e/o modalità in cui si verifica il sovraccarico: con valori maggiori in caso di carico uniformemente crescente rispetto a valori più contenuti in seguito al verificarsi di picchi improvvisi di carico.

NOTA: quando si supera il valore di taratura si ha slittamento. Il coefficiente di attrito tra le superfici di contatto da statico diventa dinamico e la coppia trasmessa cala del 30% circa.

E' quindi opportuno prevedere uno stop per poter ripartire al valore di taratura iniziale.

Calibration values feature a $\pm 10\%$ tolerance and refer to static conditions.

Under dynamic conditions the values of the slipping torque will change according to the type of overload: the values are higher if the load increase is uniform; the values are lower if sudden load peaks occur.

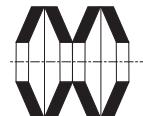

NOTE: Slipping occurs when the setting values are exceeded.

The friction coefficient between the contact surfaces from static becomes dynamic and the transmitted torque is approx. 30% lower.

It is advisable to have a stop first in order to have a restart based on the initial setting value.

Disposizione delle molle
Washers' arrangement
Lage der Feder

IN SERIE (min. coppia, max. sensibilità)
SERIES (min. torque, max sensitivity)
SERIE (min. Moment, max. Empfindlichkeit)

auf und beziehen sich auf statische Bedingungen.

Unter dynamischen Bedingungen hat das Rutschmoment verschiedene Werte je nach Art der Überbelastung. Die Werte sind höher, wenn die Belastung gleichmäßig zunimmt; sie sind niedriger im Falle von plötzlichen Belastungsspitzen.

BEMERKUNG: Rutschen tritt auf, wenn die eingestellten Werte überschritten werden. Der Reibungsfaktor zwischen den Berührungsflächen wird dynamisch anstatt statisch und das übertragene Drehmoment sinkt um ca. 30%.

Es ist daher ratsam, vor dem erneuten Anfahren anzuhalten, um die ursprünglichen Drehmomentwerte zu erreichen.

3.10 Limitatore di coppia cavo passante

E' importante notare che la coppia di slittamento non resta sempre la medesima durante tutta la vita del limitatore.

Tende infatti a diminuire in rapporto al numero e alla durata degli slittamenti che, rodando le superfici di contatto, ne aumentano il rendimento.

E' quindi opportuno verificare periodicamente, soprattutto durante la fase di rodaggio, la taratura del dispositivo.

Là dove sia richiesto un errore più contenuto nella taratura, è necessario testare la coppia trasmissibile sull'impianto.

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo diversa indicazione espressa in fase di ordinazione.

3.10 Torque limiter with through hollow shaft

It is important to note that the slipping torque is not the same for the whole life of the torque limiter.

It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lapsing will increase the efficiency.

For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period.

Should a smaller calibration error be required, it is necessary to test the transmissible torque on the plant.

The device is supplied already calibrated at the torque reported in the catalogue T_{2M}, unless otherwise specified in the order.

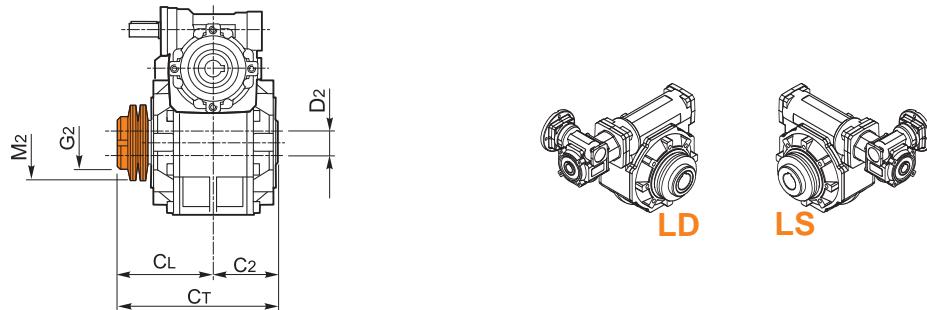

3.10 Drehmomentbegrenzer mit durchgehender Hohlwelle

Es ist wichtig zu beachten, dass das Rutschmoment über die gesamte Lebensdauer der Rutschkupplung nicht konstant bleibt, sondern üblicherweise in Verbindung mit längeren Rutschzyklen aufgrund der eingelaufenen Berührungsflächen abnimmt.

Deswegen ist es ratsam, die Eichung der Vorrichtung besonders während der Einlaufzeit zu prüfen.

Falls ein niedrigerer Eichfehler gewünscht ist, sollte das übertragbare Drehmoment auf der Anlage getestet werden.

Wenn die Vorrichtung geliefert wird, ist sie schon auf das im Katalog T_{2M} angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders angegebene wird.

() A richiesta / On request / Auf Anfrage

Nella versione con limitatore non è prevista la fornitura degli alberi lenti.

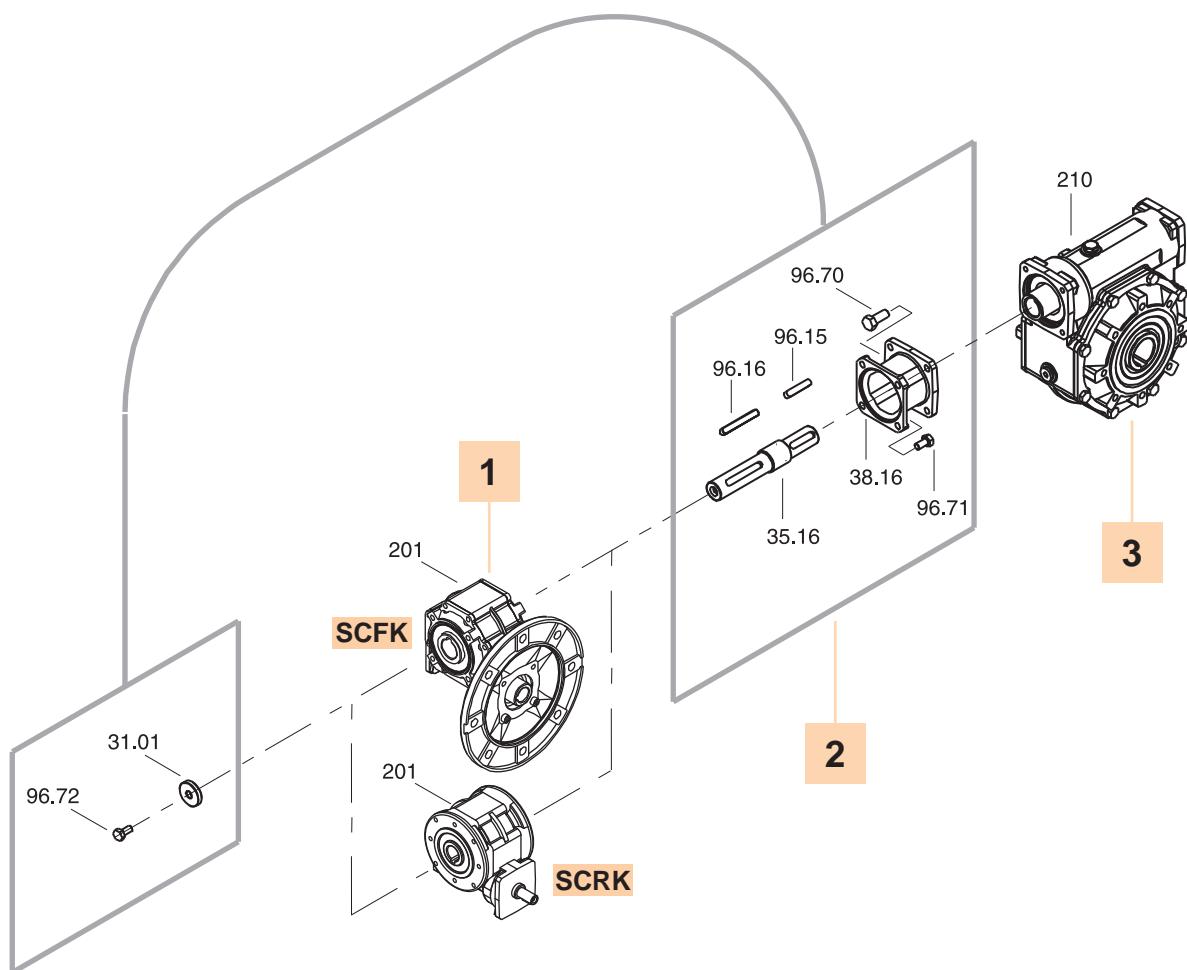

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo diversa indicazione espressa in fase di ordinazione.

The version with torque limiter is supplied without output shafts.

The device is supplied already calibrated at the torque reported in the catalogue T_{2M}, unless otherwise specified in the order.

Die Version mit Drehmomentbegrenzer wird ohne Abtriebswellen geliefert.

Wenn die Vorrichtung geliefert wird, ist sie schon auf dem im Katalog T_{2M} angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders angegeben wird.

4.1 Caratteristiche

I riduttori della serie a vite senza fine BFK - BRK si presentano estremamente leggeri grazie alla forma compatta e la cassa realizzata in alluminio pressofuso. La serie presenta una svariata possibilità di versioni, con e senza piedi e con numerosi accessori che la rendono più versatile nell'impiego delle più svariate tipologie di applicazioni.

La vite senza fine è in acciaio legato cementato-temprato ed è rettificata. La corona ha mozzo in ghisa con riporto di fusione in bronzo.

4.1 Characteristics

The BFK - BRK worm gearboxes are extremely light thanks to the compact shape of the housing made of cast aluminum. This series features a wide range of versions, with and without feet, with numerous accessories which make it extremely versatile for utilization in various applications.

The worm shaft is ground and is made of hardened-casehardened compound steel.

The worm wheel features a cast iron hub with bronze casting.

4.1 Merkmale

Die Schneckengetriebe der BFK - BRK Serie sind äußerst leicht dank der kompakten Form des Gehäuses aus Aluminiumguss. Die Serie bietet verschiedene Versionen mit und ohne Füße sowie zahlreiche Zubehörteile an, was zur vielseitigen Anwendbarkeit der Getriebe in vielerlei Applikationen dient.

Die Schneckenwelle ist aus legierten gehärteten Einsatzstahl und ist geschliffen. Die Zahnkrone verfügt über eine Nabe aus Gusseisen mit Schmelzeneinsatz aus Bronze.

Specificare sempre in fase di ordinazione la versione.

Specify the version when ordering.

Bei der Bestellung immer die Bauform angeben.

4.3 Lubrificazione

Riduttori a vite senza fine BFK - BRK sono forniti tutti e sempre completi di lubrificante sintetico a base PAG con classe di viscosità ISO 320. Nei corpi in alluminio 30, 40, 50, 63, 75 è presente un solo tappo di riempimento olio.

Quantità di lubrificante (litri)

BFK BRK	B3	B6-B7	B8	V5-V6
30		0.015		
40		0.040		
50		0.080		
63		0.160		
75		0.260		

Lubricant quantity (liters)

4.3 Schmierung

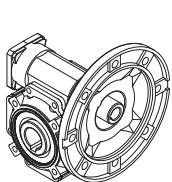

BFK - BRK worm gearboxes are supplied with PAG synthetic lubricant featuring an ISO 320 viscosity class. Aluminium housings size 30, 40, 50, 63 and 75 have one filling plug only.

BFK - BRK Schneckengetriebe werden mit PAG synthetischen Schmierstoff Viskositätsklasse ISO 320 geliefert. Gehäuse aus Aluminium Größe 30, 40, 50, 63 und 75 verfügen über nur eine Einfüllschraube.

* ATTENZIONE: la coppia massima utilizzabile [T_{2M}] deve essere calcolata utilizzando il fattore di servizio: $T_{2M} = T_2 \times FS'$

* WARNING: Maximum allowable torque [T_{2M}] must be calculated using the following service factor : $T_{2M} = T_2 \times FS'$

* ACHTUNG: das max. anwendbare Drehmoment [T_{2M}] muss mit folgendem Betriebsfaktor berechnet werden: $T_{2M} = T_2 \times FS'$

Kegelrollenlager für Schneckenrad

4.10 Limitatore di coppia cavo passante

Il limitatore di coppia viene consigliato in tutte quelle applicazioni che richiedono una limitazione sulla coppia trasmissibile per proteggere l'impianto e/o preservare il riduttore evitando sovraccarichi o urti indesiderati quanto inaspettati.

È un dispositivo con albero dotato di cavo passante, con funzionamento a frizione, ed è integrato al riduttore, presentando un ingombro limitato.

Concepito per lavorare a bagno d'olio, il dispositivo risulta affidabile nel tempo ed è esente da usura se non viene mantenuto in condizioni prolungate di slittamento (condizione che si verifica quando la coppia presenta valori superiori a quelli di taratura).

La taratura è facilmente regolabile dall'esterno attraverso il serraggio di una ghiera autobloccante che porta a compres-sione le 4 molle a tazza disposte tra loro in serie.

Il dispositivo non consente:

- l'impiego di cuscinetti a rulli conici in uscita
- funzionamento prolungato in condizio-ni di slittamento.

Nella tabella seguente vengono riportati i valori delle coppie di slittamento M_{2S} in funzione del n° di giri della ghiera.

I valori di taratura presentano una tolle-ranza del $\pm 10\%$ e si riferiscono ad una condizione statica.

In condizioni dinamiche è da notare che la coppia di slittamento assume valori di-versi a seconda del tipo e/o modalità in cui si verifica il sovraccarico: con valori maggiori in caso di carico uniformemente crescente rispetto a valori più contenuti in seguito al verificarsi di picchi improvvisi di carico.

NOTA: quando si supera il valore di taratura si ha slittamento. Il coefficiente di attrito tra le superfici di contatto da statico diventa dinamico e la coppia trasmessa cala del 30% circa.

E' quindi opportuno prevedere uno stop per poter ripartire al valore di taratura ini-ziale.

E' importante notare che la coppia di slit-tamento non resta sempre la medesima durante tutta la vita del limitatore.

Tende infatti a diminuire in rapporto al numero e alla durata degli slittamenti che, rodando le superfici di contatto, ne au-mentano il rendimento.

È quindi opportuno verificare periodica-mente, soprattutto durante la fase di ro-daggio, la taratura del dispositivo.

Là dove sia richiesto un errore più conte-nuto nella taratura, è necessario testare la coppia trasmissibile sull'impianto.

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo di-versa indicazione espressa in fase di or-dinazione.

4 BFK - BRK

4.10 Torque limiter with through hollow shaft

The use of a torque limiter is advisable when the application requires the limitation of the transmissible torque to safe-guard the plant and/or the gearbox from unexpected or undesired overloads.

The torque limiter is equipped with a through hollow shaft and a friction clutch. It is integrated in the gearbox, therefore space requirement is limited.

Designed to be working in oil bath, the de-vice is reliable over time and is not sub-ject to wear unless in case of operation with prolonged slipping (it occurs when the torque values are higher than the cali-bration values).

Calibration can be easily adjusted from outside by tightening of the self-locking ring nut, which causes the compression of the 4 Belleville washers arranged in series.

The device does not go together with:

- the use of tapered roller bearings at output
- prolonged operation under slipping conditions

The following table shows the values of M_{2S} slipping torques depending on the number of revolutions of the ring nut.

Calibration values feature a $\pm 10\%$ tolerance and refer to static conditions.

Under dynamic conditions the values of the slipping torque will change accord-ing to the type of overload: the values are higher if the load increase is uniform; the values are lower if sudden load peaks oc-cur.

NOTE: Slipping occurs when the setting values are exceeded.

The friction coefficient between the con-tact surfaces from static becomes dy-namic and the transmitted torque is ap-prox. 30% lower.

It is advisable to have a stop first in order to have a restart based on the initial set-ting value.

It is important to note that the slipping torque is not the same for the whole life of the torque limiter.

It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lap-ping will increase the efficiency.

For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period.

Should a smaller calibration error be re-quired, it is necessary to test the trans-missible torque on the plant.

The device is supplied already calibrated at the torque reported in the catalogue T_{2M} , unless otherwise specified in the or-der.

4.10 Drehmomentbegrenzer mit durchgehender Hohlwelle

Die Anwendung eines Drehmoment- Die Anwendung eines Drehmoment- begrenzers wird empfohlen, um die Anlage und/ oder das Getriebe gegen ungewünschte und unerwartete Überbelastungen zu schützen.

Es handelt sich um eine Vorrichtung mit einer durchgehenden Hohlwelle.

Er ist in dem Getriebe integriert, d.h. der Raumbedarf ist klein. Der Begrenzer wurde für Betrieb in einem Ölbad entworfen. Er ist zuverlässig und verschleißfrei (nur im Falle eines dauerhaften Rutschens entsteht Verschleiß, hier ist das Drehmoment größer als der eingestellte Eichwert).

Die Eichung kann mühelos von aussen durch das Anziehen einer selbstsperrenden Mutter ausgeführt werden, dadurch wird der Druck auf die 4 wechselseitig angeordneten Tellerfedern erhöht.

Die Vorrichtung sieht das folgende nicht vor:

- die Verwendung von Kegelrollenlager am Abtrieb
- Längerer Rutschbetrieb

Die nachstehende Tabelle zeigt die Werte der Rutschmomente M_{2S} abhängig von der Anzahl der Umdrehungen der Mutter. Die Eichwerte weisen $\pm 10\%$ Toleranz auf und beziehen sich auf statische Bedin-gungen.

Unter dynamischen Bedingungen hat das Rutschmoment verschiedene Werte je nach Art der Überbelastung. Die Werte sind höher, wenn die Belastung gleichmäßi-g zuminimmt; sie sind niedriger im Falle von plötzlichen Belastungsspitzen.

BEMERKUNG: Rutschen tritt auf, wenn die eingestellten Werte überschritten werden. Der Reibungsfaktor zwischen den Berührungsflächen wird dynamisch anstatt statisch und das übertragene Dreh-moment sinkt um ca. 30%.

Es ist daher ratsam, vor dem erneuten Anfahren anzuhalten, um die ursprüng-lichen Drehmomentwerte zu erreichen.

Es ist wichtig zu beachten, dass das Rutschmoment über die gesamte Le-bensdauer der Rutschkupplung nicht konstant bleibt, sondern üblicherweise in Verbindung mit längeren Rutschzyklen aufgrund der eingelaufenen Berührungs-flächen abnimmt.

Deswegen ist es ratsam, die Eichung der Vorrichtung besonders während der Ein-laufzeit zu prüfen.

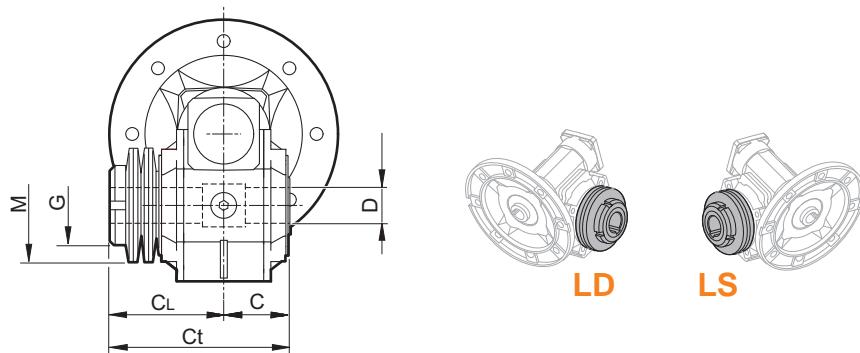

Falls ein niedrigerer Eichfehler gewünscht ist, sollte das übertragbare Drehmoment auf der Anlage getestet werden.

Wenn die Vorrichtung geliefert wird, ist sie schon auf das im Katalog T_{2M} angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders ange-gabe wird.

5.1 Caratteristiche

La combinazione di due riduttori a vite senza fine comporta rendimenti molto bassi, ma l'elevata riduzione di velocità ottenuta in uno spazio ridottissimo rende comunque interessante, e a volte insostituibile, questa soluzione.

Sono forniti con albero cavo di serie ed esiste un'ampia gamma di accessori: seconda entrata, cuscinetti conici sulla corona, flangia uscita, albero lento con 1 o 2 sporgenze, limitatore di coppia con cavo passante, braccio di reazione.

5.1 Characteristics

The combination of two worm gearboxes provides very low efficiency, however the fact that substantial reduction in speed can be obtained in an extremely reduced space makes this solution very interesting and sometimes irreplaceable.

The hollow shaft is supplied as standard. A broad range of accessories is available: second input, tapered roller bearings on the worm wheel, output flange, single or double extended output shaft, torque limiter with through hollow shaft, torque arm.

5.1 Merkmale

Die Kombination zweier Schneckengetriebe bringt sehr niedrigen Wirkungsgrad mit sich, es handelt sich jedoch um eine interessante und manchmal unersetzbare Lösung, weil eine hohe Drehzahlverringerung in einem beträchtlich reduzierten Raum erzielt werden kann.

Die Hohlwelle gehört zur serienmäßigen Ausstattung. Eine breite Auswahl an Zubehör ist erhältlich: zweiter Antrieb, Kegelrollenlager auf Schneckenrad, Abtriebsflansch, standard oder doppelseitig herausragende Abtriebswelle, Drehmomentbegrenzer mit durchgehender Hohlwelle, Drehmomentstütze.

5.3 Lubrificazione

I riduttori a vite senza fine BCFK - BCRK sono forniti tutti e sempre completi di lubrificante sintetico a base PAG con classe di viscosità ISO 320.
Nei corpi in alluminio è presente un solo tappo di riempimento olio.
Si raccomanda di precisare sempre in fase di ordine la forma costruttiva e la posizione di lavoro desiderata.

5.3 Lubrication

BCFK - BCRK worm gearboxes are supplied with PAG synthetic lubricant featuring an ISO 320 viscosity class.
Aluminium housings have one filling plug only.
Always specify the version and the mounting position when ordering.

5.3 Schmierung

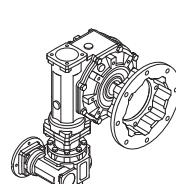

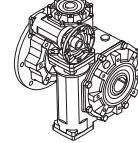

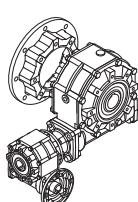

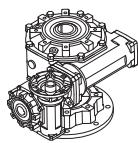

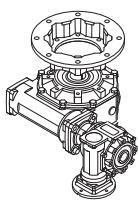

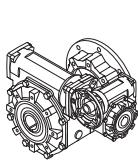

BCFK - BCRK Schneckengetriebe werden mit PAG synthetischen Schmierstoff Viskositätsklasse ISO 320 geliefert.
Gehäuse aus Aluminium verfügen über nur eine Einfüllschraube.
Im Auftrag sind immer Einbaulage und Bauform anzugeben.

L'entrata supplementare del riduttore in uscita (SeA2) non può essere utilizzata come comando in quanto il relativo movimento risulta impedito dalla irreversibilità del primo riduttore.

Utilizzato come asse condotto, avrà velocità corrispondente a quella di ingresso ridotta del rapporto del primo riduttore.

The second input shaft of the output gearbox (SeA2) can not be utilized as a drive because its motion will be stopped by the reversibility of the first gearbox.

If utilized as a drive shaft its speed will be equal to the input speed decreased by the ratio of the first gearbox.

Die verlängerte Schneckenwelle des zweiten Getriebes (SeA2) kann nicht als Antrieb verwendet werden, da die Selbsthemmung des ersten Getriebes entgegen gewirkt.

Wird sie als Abtriebswelle verwendet, besitzt sie eine um die Untersetzung des ersten Getriebes entsprechend reduzierte Drehzahl und Drehmoment.

5 BCFK - BCRK

5.10 Limitatore di coppia cavo passante

Il limitatore di coppia viene consigliato in tutte quelle applicazioni che richiedono una limitazione sulla coppia trasmissibile per proteggere l'impianto e/o preservare il riduttore evitando sovraccarichi o urti indesiderati quanto inaspettati.

È un dispositivo con albero dotato di cavo passante, con funzionamento a frizione, ed è integrato al riduttore, presentando un ingombro limitato.

Concepito per lavorare a bagno d'olio, il dispositivo risulta affidabile nel tempo ed è esente da usura se non viene mantenuto in condizioni prolungate di slittamento (condizione che si verifica quando la coppia presenta valori superiori a quelli di taratura).

La taratura è facilmente regolabile dall'esterno attraverso il serraggio di una ghiera autobloccante che porta a compresione le 4 molle a tazza disposte tra loro in serie.

Il dispositivo non consente:

- l'impiego di cuscinetti a rulli conici in uscita
- funzionamento prolungato in condizioni di slittamento.

Nella tabella seguente vengono riportati i valori delle coppie di slittamento M_{2S} in funzione del n° di giri della ghiera.

5.10 Torque limiter with through hollow shaft

The use of a torque limiter is advisable when the application requires the limitation of the transmissible torque to safeguard the plant and/or the gearbox from unexpected or undesired overloads.

The torque limiter is equipped with a through hollow shaft and a friction clutch. It is integrated in the gearbox, therefore space requirement is limited.

Designed to be working in oil bath, the device is reliable over time and is not subject to wear unless in case of operation with prolonged slipping (it occurs when the torque values are higher than the calibration values).

Calibration can be easily adjusted from outside by tightening of the self-locking ring nut, which causes the compression of the 4 Belleville washers arranged in series.

The device does not go together with:

- the use of tapered roller bearings at output
- prolonged operation under slipping conditions

The following table shows the values of M_{2S} slipping torques depending on the number of revolutions of the ring nut.

5.10 Drehmomentbegrenzer mit durchgehender Hohlwelle

Die Anwendung eines Drehmomentbegrenzers wird empfohlen, um die Anlage und/oder das Getriebe gegen ungewünschte und unerwartete Überbelastungen zu schützen.

Es handelt sich um eine Vorrichtung mit einer durchgehenden Hohlwelle.

Er ist in dem Getriebe integriert, d.h. der Raumbedarf ist klein. Der Begrenzer wurde für Betrieb in einem Ölbad entworfen.

Er ist zuverlässig und verschleißfrei (nur im Falle eines dauerhaften Rutschens entsteht Verschleiß, hier ist das Drehmoment größer als der eingestellte Eichwert).

Die Eichung kann mühelos von aussen durch das Anziehen einer selbstsperrenden Mutter ausgeführt werden, dadurch wird der Druck auf die 4 wechselseitig angeordneten Tellerfedern erhöht.

Die Vorrichtung sieht das folgende nicht vor:

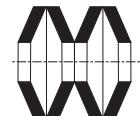

- die Verwendung von Kegelrollenlager am Abtrieb
- Längerer Rutschbetrieb

Die nachstehende Tabelle zeigt die Werte der Rutschmomente M_{2S} abhängig von der Anzahl der Umdrehungen der Mutter. Die Eichwerte weisen $\pm 10\%$ Toleranz

BCFK BCRK	N°. giri della ghiera di regolazione / N°. revolutions of ring nut Nr. Umdrehungen der Mutter

IN SERIE (min. coppia, max. sensibilità)
SERIES (min. torque, max sensitivity)
SERIE (min. Moment, max. Empfindlichkeit)

I valori di taratura presentano una tolleranza del $\pm 10\%$ e si riferiscono ad una condizione statica.

In condizioni dinamiche è da notare che la coppia di slittamento assume valori diversi a seconda del tipo e/o modalità in cui si verifica il sovraccarico: con valori maggiori in caso di carico uniformemente crescente rispetto a valori più contenuti in seguito al verificarsi di picchi improvvisi di carico.

NOTA: quando si supera il valore di taratura si ha slittamento. Il coefficiente di attrito tra le superfici di contatto da statico diventa dinamico e la coppia trasmessa cala del 30% circa.

E' quindi opportuno prevedere uno stop per poter ripartire al valore di taratura iniziale.

Calibration values feature a $\pm 10\%$ tolerance and refer to static conditions.

Under dynamic conditions the values of the slipping torque will change according to the type of overload: the values are higher if the load increase is uniform; the values are lower if sudden load peaks occur.

NOTE: Slipping occurs when the setting values are exceeded.

The friction coefficient between the contact surfaces from static becomes dynamic and the transmitted torque is approx. 30% lower.

It is advisable to have a stop first in order to have a restart based on the initial setting value.

auf und beziehen sich auf statische Bedingungen.

Unter dynamischen Bedingungen hat das Rutschmoment verschiedene Werte je nach Art der Überbelastung. Die Werte sind höher, wenn die Belastung gleichmäßig zunimmt; sie sind niedriger im Falle von plötzlichen Belastungsspitzen.

BEMERKUNG: Rutschen tritt auf, wenn die eingestellten Werte überschritten werden. Der Reibungsfaktor zwischen den Berührungsflächen wird dynamisch anstatt statisch und das übertragene Drehmoment sinkt um ca. 30%.

Es ist daher ratsam, vor dem erneuten Anfahren anzuhalten, um die ursprünglichen Drehmomentwerte zu erreichen.

5.10 Limitatore di coppia cavo passante

E' importante notare che la coppia di slittamento non resta sempre la medesima durante tutta la vita del limitatore.

Tende infatti a diminuire in rapporto al numero e alla durata degli slittamenti che, rodando le superfici di contatto, ne aumentano il rendimento.

E quindi opportuno verificare periodicamente, soprattutto durante la fase di rodaggio, la taratura del dispositivo.

Là dove sia richiesto un errore più contenuto nella taratura, è necessario testare la coppia trasmissibile sull'impianto.

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo diversa indicazione espressa in fase di ordinazione.

5.10 Torque limiter with through hollow shaft

It is important to note that the slipping torque is not the same for the whole life of the torque limiter.

It usually decreases in connection with the numbers and the duration of the slipping which because of the surfaces' lapsing will increase the efficiency.

For this reason it is advisable to check the calibration of the device at regular intervals, specially during the running-in period.

Should a smaller calibration error be required, it is necessary to test the transmissible torque on the plant.

The device is supplied already calibrated at the torque reported in the catalogue T_{2M}, unless otherwise specified in the order.

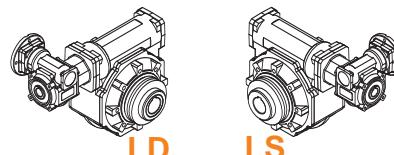

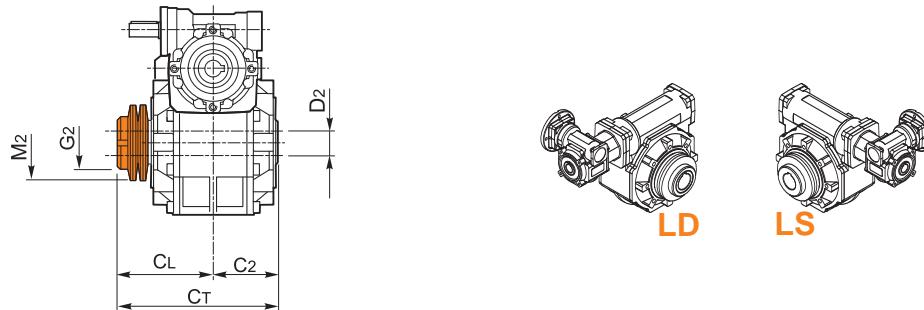

5.10 Drehmomentbegrenzer mit durchgehender Hohlwelle

Es ist wichtig zu beachten, dass das Rutschmoment über die gesamte Lebensdauer der Rutschkupplung nicht konstant bleibt, sondern üblicherweise in Verbindung mit längeren Rutschzyklen aufgrund der eingelaufenen Berührungsflächen abnimmt.

Deswegen ist es ratsam, die Eichung der Vorrichtung besonders während der Einlaufzeit zu prüfen.

Falls ein niedrigerer Eichfehler gewünscht ist, sollte das übertragbare Drehmoment auf der Anlage getestet werden.

Wenn die Vorrichtung geliefert wird, ist sie schon auf das im Katalog T_{2M} angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders angegebene wird.

() A richiesta / On request / Auf Anfrage

Nella versione con limitatore non è prevista la fornitura degli alberi lenti.

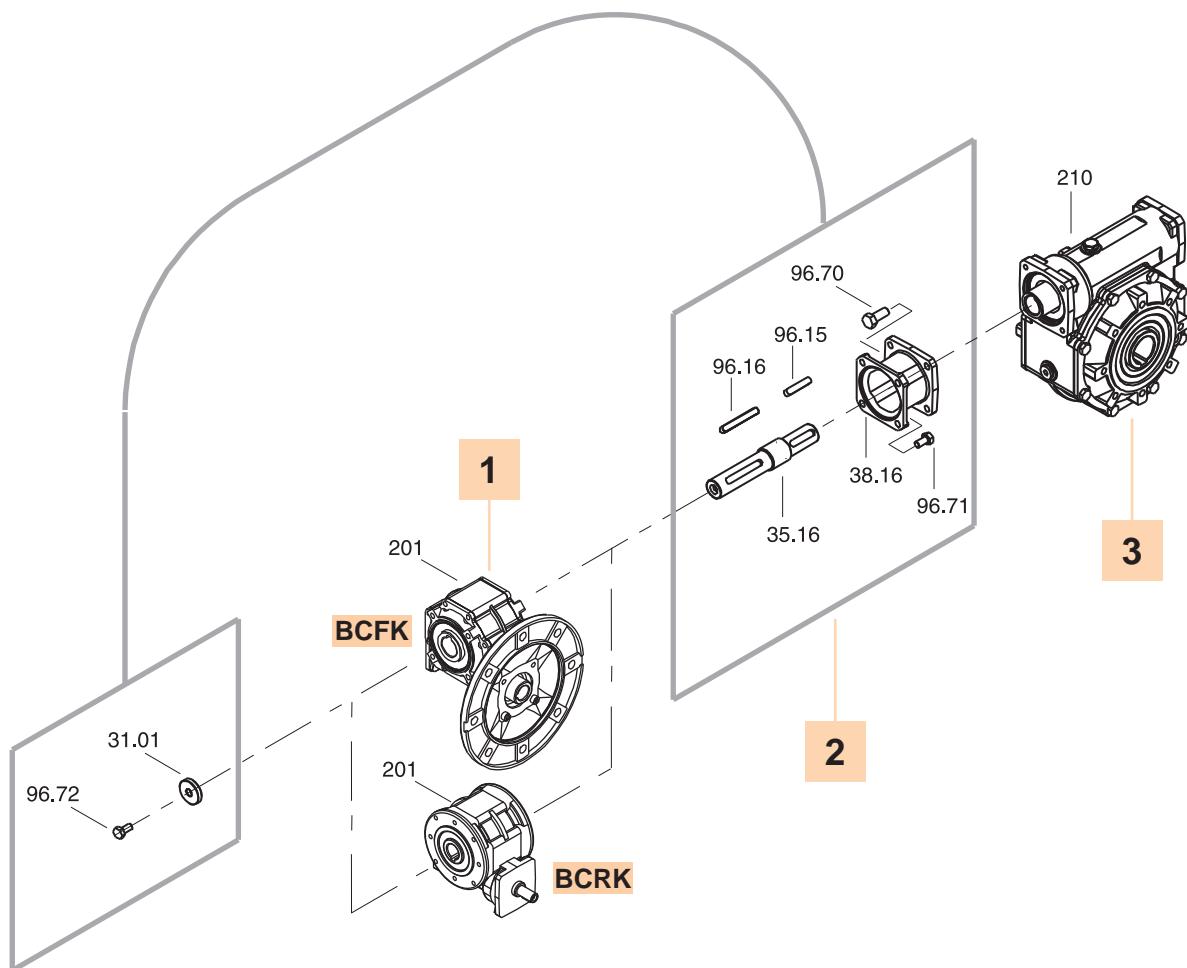

Il dispositivo viene consegnato tarato alla coppia riportata a catalogo T_{2M} salvo diversa indicazione espressa in fase di ordinazione.

The version with torque limiter is supplied without output shafts.

The device is supplied already calibrated at the torque reported in the catalogue T_{2M}, unless otherwise specified in the order.

Die Version mit Drehmomentbegrenzer wird ohne Abtriebswellen geliefert.

Wenn die Vorrichtung geliefert wird, ist sie schon auf dem im Katalog T_{2M} angegebenen Drehmoment geeicht, ausser wenn es in der Bestellung anders angegeben wird.

CONDIZIONI GENERALI DI GARANZIA

La garanzia relativa a difetti di costruzione ha la durata di un anno dalla data di fatturazione delle merce. Tale garanzia comporta per la TRAMEC Riduttori l'onere della sostituzione o riparazione delle parti difettose ma non ammette ulteriore addebito per eventuali danni diretti o indiretti di qualsiasi natura. La garanzia decade nel caso in cui non siano state osservate le disposizioni riportate nel manuale di uso e manutenzione e/o siano state eseguite riparazioni o apportate modifiche senza nostro consenso scritto.

La merce di ritorno sarà da noi accettata solo se spedita franco di ogni spesa.

WARRANTY GENERAL CONDITIONS

Gearboxes are covered for manufacturing defects by a one-year warranty from their invoicing date. TRAMEC Riduttori will replace or repair defective parts but will not accept any further charges for direct or indirect damages of any kind. The warranty will become null and void if the instructions given in the use and maintenance manual are not complied with or if repairs or changes are carried out without our prior written authorization.

Returned goods will be accepted only if delivered free of any charge.

ALLGEMEINE GARANTIEBEDINGUNGEN

Die Garantie auf Herstellungsfehler dauert ein Jahr ab Rechnungsdatum. Aufgrund der Garantie unterliegt der TRAMEC Riduttori der Pflicht des Ersatzes oder der Reparatur der defekten Teile, jedoch nicht die Übernahme weiterer Belastungen für direkte oder indirekte Schäden egal welcher Natur. Die Garantie verfällt bei Nichtbeachtung der in der betreffenden „Betriebs- und Instandhaltungsanleitung“ angeführten Anweisungen und/oder falls ohne unsere vorausgehende schriftliche Genehmigung Reparaturen oder Änderungen vorgenommen wurden.

Die an uns zurückgesendete Ware akzeptieren wir nur, wenn sie gebührenfrei geliefert wird.
